Very High Fire Hazard Severity Zone (VHFHSZ) – this is the risk assessment of greatest concern. Most of these properties are found within areas with recent fire history, homes exposed to large open space areas and with limited fire apparatus access due to creeks and topography.

High Fire Hazard Severity Zone (HFHSZ) – this is a risk assessment area of concern. Most of these properties have many of the same risk assessment factors (structure threat, topography, population use, etc...) as the VHFHSZ areas do, but have not had any recent fire history.

Moderate Fire Hazard Severity Zone (MFHSZ) – this is a risk assessment area of some concern. Many of these properties have one or two risk assessment factors present but generally have not demonstrated a cumulative issue.

- Wildland Urban Interface (WUI) > 5 Structures – the placement of the structure (flat drainage, on top of a canyon wall, mid-slope) can all effect the risk of a fire front approaching the structure.
- Wildland Fire History - Has location had past fires
- Ability of Fire personnel and equipment to access site
- Fire Spread Potential (fuel type, aspect and topography based)
- Area used by the public
